1. What are the six criteria used by psychologists, psychiatrists, and behavioral scientists to make a determination for “abnormal behavior”?

   a.
   
   b.
   
   c.
   
   d.
   
   e.
   
   f.

2. ____________________________________ questioned whether the characteristics that lead to psychological diagnoses reside in the ______________________________________ or in the ______________________________________ in which the observers (those who do the diagnosing) find the patients.

3. What was the method for Rosenhan’s study?

4. True or false (circle one): Not one of the pseudopatients was detected by anyone on the hospital staff, but some of the real patients in the facilities voiced suspicion.

5. How were the pseudopatients treated (both socially and medically) inside the hospital?

6. Rosenhan’s study demonstrated that even trained professionals often ______________________________

   ______________________________________ in a hospital setting.

7. What did Rosenhan mean by the “danger of diagnostic labels”?

8. Which of the recent applications of Rosenhan’s study did you find to be most interesting? Explain why.
